Modality-Dependent Cross-Media Retrieval

YUNCHAO WEI, YAO ZHAO, ZHENFENG ZHU, SHIKUI WEI, and YANHUI XIAO,
Beijing Jiaotong University
JIASHI FENG and SHUICHENG YAN, National University of Singapore

In this article, we investigate the cross-media retrieval between images and text, that is, using image to search text (I2T) and using text to search images (T2I). Existing cross-media retrieval methods usually learn one couple of projections, by which the original features of images and text can be projected into a common latent space to measure the content similarity. However, using the same projections for the two different retrieval tasks (I2T and T2I) may lead to a tradeoff between their respective performances, rather than their best performances. Different from previous works, we propose a modality-dependent cross-media retrieval (MDCR) model, where two couples of projections are learned for different cross-media retrieval tasks instead of one couple of projections. Specifically, by jointly optimizing the correlation between images and text and the linear regression from one modal space (image or text) to the semantic space, two couples of mappings are learned to project images and text from their original feature spaces into two common latent subspaces (one for I2T and the other for T2I). Extensive experiments show the superiority of the proposed MDCR compared with other methods. In particular, based on the 4,096-dimensional convolutional neural network (CNN) visual feature and 100-dimensional Latent Dirichlet Allocation (LDA) textual feature, the mAP of the proposed method achieves the mAP score of 41.5%, which is a new state-of-the-art performance on the Wikipedia dataset.

Categories and Subject Descriptors: H.3.3 [Information Search and Retrieval]: Retrieval models

General Terms: Design, Algorithms, Performance

Additional Key Words and Phrases: Cross-media retrieval, subspace learning, canonical correlation analysis

1. INTRODUCTION

With the rapid development of information technology, multimodal data (e.g., image, text, video, or audio) have become widely available on the Internet. For example, an image often co-occurs with text on a web page to describe the same object or event.

This work is supported in part by the National Basic Research Program of China (No.2012CB316400) and Fundamental Scientific Research Project (No.K15JB00360).

從資料庫匯入(書目格式)

[注意！]
批次匯入EndNote XML前，建議搭配檔案備份功能，將同時匯入書目與全文PDF檔。

- **BibTex (*.bib)**：LaTex文件排版系統適用格式 (Web of Science匯出)
- EndNote XML (*.xml)：[EndNote匯入使用](#)，或其他副檔名xml之匯入
- ★ **RIS(*.ris)**：資料庫常見書目格式

無法匯出.bib或者.ris格式的資料庫，
建議可使用後面的Web Importer功能匯入

安裝Web Importer

<https://www.mendeley.com/reference-management/web-importer>

The image shows a composite of two screenshots. The top screenshot is the Mendeley website's 'Web Importer' page, which features a dark blue header with the Mendeley logo and navigation links like 'Reference Management', 'Research Network', 'Datasets', 'Careers', and 'Funding'. Below the header, there are more navigation options: 'Mendeley Cite', 'Mendeley Desktop', 'Web Importer', 'Premium', and 'Help Guides'. The main content area has a teal background with the heading 'Mendeley Web Importer' and a paragraph explaining the tool's function: 'Import papers, web pages and other documents directly into your reference library from search engines and academic databases. Mendeley Web Importer is available for all major web browsers.' A red button labeled 'Get Web Importer for Chrome' is visible. A light blue callout box at the bottom of this section contains the text '適用Chrome/Firefox/Edge/Opera'. The bottom screenshot shows a browser window with the 'Mendeley Reference Manager' extension. The 'Tools' menu is open, showing options to 'Install Mendeley Web Importer' and 'Install Mendeley Cite for Microsoft Word'. Below this, a window titled 'Mendeley Reference Manager' displays a list of detected references. The first reference is checked and includes the title 'Developmental Programming of Fetal Growth and Development', authors 'S Mishchenko, A Valenti et al.', and the journal 'American Journal of Obstetrics and Gynecology, 2016'. The second reference is unchecked and includes the title 'Fetal growth velocity: the NICHD fetal growth studies conducted in 2019 Q1' and authors 'KL Grantz, PS Albert et al.'.

From Social to Sale: The Effects of Firm-Generated Content in Social Media on Customer Behavior

Given the unprecedented reach of social media, firms are increasingly relying on it as a channel for marketing communication. The objective of this study is to examine the effect of firm-generated content (FGC) in social media on three key customer metrics: spending, cross-buying, and customer profitability. The authors further investigate the synergistic effects of FGC with television advertising and e-mail communication. To accomplish their objectives, the authors assemble a novel data set comprising customers' social media participation data, transaction data, and attitudinal data obtained through surveys. The results indicate that after the advertising and e-mail marketing, FGC has a positive and significant effect that FGC works synergistically with both television advertising and e-mail. FGC is greater for more experienced, tech-savvy, and social media-prone. The effect of three characteristics of FGC: valence, receptivity, and customer satisfaction. If all three components of FGC have a positive impact, the effect of FGC reception is significant. The authors provide managerial insights regarding how to leverage social media for better results.

Keywords: social media analytics, firm-generated content, digital marketing, propensity score matching/difference-in-differences

ering codes, codes for conflict resolution, separating systems, source encoding with distortion, etc., are given a unified treatment.

1 Introduction

There is a wealth of problems that can be stated as follows: find the minimum number of rows in a binary matrix with n columns such that in every submatrix with t columns there appears (as rows) a prescribed set of vectors. We will assume n growing and t fixed. Let \hat{T} stand for the set of all possible binary t -tuples, and $T \subseteq \hat{T}$. Assume some partition of T into s nonvoid parts, namely, $T = T_1 \cup \dots \cup T_s$. Denote $T_0 = \hat{T} \setminus T$. Let T be closed under the symmetric group of permutations. If the T_i 's are stable under complementation, i.e. contain along with any vector its binary complement, we call such a partition *symmetric*.

Now the problem is to find the minimal number K of rows in an (n, t, T) array, i.e. a matrix having n columns, such that in every subset of t columns there appears at least one t -tuple from every subset T_i , $i = 1, \dots, s$.

Examples

- 1. Surjective arrays or t -independent families**
For applications in testing, hash functions, robustness of multiprocessor architectures, etc. see e.g. [1, 5, 11, 19]. Here $s = 2^t$, $T_0 = \emptyset$, and every T_i contains exactly one vector.

$s = \binom{t}{k}$. Every T_i consists of two complementary vectors, T_1 containing the two vectors $0^k 1^t$ and $1^k 0^t$, and the other T_i 's being all possible permutations of T_1 .

Most of the best results concerning K are achieved through random methods. In this paper we focus on more constructive techniques. To be precise, we need to introduce two levels of complexity for algorithms that yield (n, t, T) -arrays.

The following theorem gives us an important tool for constructing good coverings.

Theorem 1 Let A be a $(0,1)$ matrix with N rows and M columns. Assume that each row contains at least v ones, and each column at most a ones. Then there exists an $N \times K$ submatrix C with

$$K \leq N/a + (M/v) \ln a \leq (M/v)(1 + \ln a), \quad (1)$$

such that C does not contain an all-zero row.

The theorem is proved by presenting a greedy algorithm leading to a desired C .

2 (n, t, T) -arrays

Now we demonstrate how the theorem is employed to build (n, t, T) -arrays. Let A be the following incidence matrix formed by all the vectors of length t with number j by the vector v_j representing the representation of j . The number v_j is associated to every row a double number, the first part of it being a number from 1 to s , and the second part being a number from 1 to 2^t .
